

My Dashboard was based on Adoption data for each state (and District of Columbia) in the United States from 2010 to 2022. So, the dashboard has a “States & D.C.” dropdown menu. I created a proportions column by dividing “Children_Adopted” and “Children_in_Foster_Care”. These proportions were used as a slider on the dashboard with values ranging from 0 to 100. To choose the right layer of the Sankey Diagram, there are two buttons. One button is “Children Entering Foster Care” and the other is “Children Exiting Foster Care”, while the left layer of the diagram is fixed as “Children Adopted”. Additionally, the Sankey diagram is titled, based on the selected data, and the dashboard has options for adjusting height and width of the diagram. Lastly, there are two tabs, one for the Sankey diagram (plot) and one for the data.

Volume of Children Adopted to Children Entering Foster

State = **Arizona**

Minimum Proportion of Adoptions (%) = **5**

Left Layer = **“Children Adopted”**

Right Layer = **“Children Entering Foster Care”**

Arizona is set to a low portion of adoptions yet there is some variation in the rates of children being adopted versus the rate/volume of children entering foster care.

Volume of Children Adopted to Children Exiting Foster

State = **Massachusetts**

Minimum Proportion of Adoptions (%) = **10**

Left Layer = **“Children Adopted”**

Right Layer = **“Children Exiting Foster Care”**

Massachusetts is set to a higher portion of adoptions but has no variation in the rates of children being adopted versus the rate/volume of children exiting foster care.

I think it is important to show that while many states have a low proportion/percentage of children being adopted, there are cases and years in which the adoption rates surpass or match the volume of children entering and exiting foster care. However, the low adoption rates are still a significant issue, and this dashboard is primarily seeking to address such a fact.
